

## Lighting a Fire

There is nothing more frustrating than trying to light a fire and all you are getting is the fire going out.

For a good fire you will need.

1. Fire Starter Cubes – these should be available from your supermarket.
2. Kindling – which is small pieces of very dry wood
3. Solid Firewood – which your local service station should sell
4. Off course a lighter or matches

Place some kindling flat on the bottom of the barrel, make sure you keep the lid open while you have the fire going

Then place 3 or 4 lighter cubes on the kindling and then build a tepee over the top of the cubes.

Allow enough space between the kindling to allow air to get into the bottom of the barrel. Your tepee should not be any bigger than 40 cm X 40 cm

Light the cubes and wait until the kindling catches fire. Feed a little more kindling onto the fire once it is alight.

After 5 – 10 minutes place a larger log of your wood preference onto the fire.

We encourage you to use sustainable wood or coal bricks.
